

CLAIMS

What is claimed is:

1 1. A method of production planning comprising:
2 receiving production objects , wherein each object has at least one attribute;
3 calculating a plurality of preference scores according to the attributes of the
4 production objects; wherein each preference score represents desirability
5 of transition from manufacturing a first object to a second object; and
6 identifying a suggested production plan which includes a sequence order of two or
7 more production objects in response to the preference scores.

1 2. The method of claim 1, wherein calculating a plurality of preference scores
2 further includes identifying transition preference values associated with the attributes.

1 3. The method of claim 2, wherein calculating a plurality of preference scores
2 further includes utilizing statistical algorithm to compute transition preference values.

1 4. The method of claim 2, wherein identifying transition preference values further
2 includes obtaining transition preference values from historical database.

1 5. The method of claim 1, wherein calculating a plurality of preference scores
2 further includes identifying a portion of the preference scores represents desirability of
3 transition from manufacturing the first object to a third object.

1 6. A method of adaptive learning comprising:
2 identifying a plurality of attributes in response to production tasks;

3 obtaining a plurality of transition preference values in response to the plurality of
4 attributes;
5 calculating a plurality of preference scores in response to the plurality of
6 transition preference values;
7 providing the plurality of preference scores to a decision engine; and
8 receiving a final production plan.

1 7. The method of claim 6, further comprising updating the planning preferences
2 in response to the final production plan.

1 8. The method of claim 6, wherein the identifying a plurality of attributes further
2 includes identifying a plurality of attributes associated with each production object.

1 9. The method of claim 6, wherein the identifying a plurality of attributes in
2 response to a required production objects further includes obtaining a plurality of
3 production considerations from the required production objects.

1 10. The method of claim 9, wherein the plurality of production consideration
2 further includes identifying demand of goods to be produced.

1 11. The method of claim 9, wherein the plurality of production considerations
2 further includes identifying changeover durations between the production objects.

1 12. The method of claim 9, wherein the plurality of production considerations
2 further includes identifying production rates and capacities to produce the required
3 production objects.

1 13. The method of claim 6, wherein the identifying a plurality of transitions
2 further includes identifying a combination of transitions between the production objects
3 in response to the plurality of attributes.

1 14. The method of claim 6, wherein the obtaining a plurality of transition
2 preference values further includes identifying a numerical value representing a transition
3 from a first object to a second object in response to similarity of attribute values for the
4 first and second objects.

1 15. The method of claim 6, wherein the obtaining a plurality of transition
2 preference values in response to the plurality of attributes from a historical planning data
3 storage further includes identifying a recent past planning preference from a distant past
4 planning preference.

1 16. The method of claim 6, the predefined algorithm further includes utilizing a
2 statistical algorithm to derive the preference score.

1 17. The method of claim 6, wherein the providing the preference score as at least
2 a portion of quantified planning preferences to a decision engine further includes
3 providing a plurality of modified parameters in response to the preference score.

1 18. The method of claim 6, wherein the updating the planning preferences
2 relating to the required production objects in response to the final production plan further
3 includes identifying a plurality of planner's adjustments.

1 19. The method of claim 18, wherein the updating the planning preferences
2 further includes modifying the transition preference values associated with the required
3 production objects in response to the plurality of planner's adjustments.

1 20. A method of manufacturing planning system comprising:
2 an adaptive learning of planning preferences of claim 6; and
3 a decision engine, wherein the decision engine receives inputs from the adaptive
4 learning of planning preferences and outputs a suggested plan.

1 21. A method of manufacturing planning system comprising:
2 providing a scenario description to a decision engine; and
3 providing planning preferences to the decision engine, wherein the planning
4 preferences is obtained from a historical data storage; and
5 generating a suggested plan in response to the scenario description and planning
6 preferences.

1 22. The method of claim 21 further comprising:
2 receiving a description of production requirements;
3 obtaining planning preferences from the adaptive learning engine;
4 adjusting the suggested plan to create a final plan;
5 providing the final plan to the adaptive learning engine; and
6 modifying the planning preferences in response to the final plan.

1 23. The method of claim 22, wherein the receiving a description of production
2 requirements includes identifying at least one item to be manufactured.

1 24. The method of claim 22, wherein the obtaining planning preferences from the
2 adaptive learning engine further includes identifying a plurality of attributes associated
3 with the production requirements.

1 25. The method of claim 24, wherein the identifying a plurality of attributes
2 associated with the production requirements further includes obtaining a plurality of
3 transition preference values associated with the plurality of attributes.

1 26. The method of claim 25, wherein the obtaining a plurality of transition
2 preference values associated with the plurality of attributes further includes calculating a
3 plurality of planning preferences in response to the plurality of transition preference
4 values.

1 27. The method of claim 22, wherein the adjusting the suggested plan to create a
2 final plan further includes modifying at least one parameter of the planning preferences
3 by a planner.

1 28. The method of claim 22, wherein the adjusting the suggested plan to create a
2 final plan further includes modifying at least one parameter of the planning preferences in
3 response to inputs from the adaptive learning engine.

1 29. The method of claim 22, wherein the modifying the planning preferences in
2 response to the final plan further includes storing updated planning preferences to a local
3 storage.

1 30. The method of claim 22, wherein the modifying the planning preferences in
2 response to the final plan further includes storing updated planning preferences to a
3 remote storage.

1 31. The method of claim 22, wherein the modifying the planning preferences in
2 response to the final plan further includes storing updated planning preferences to a
3 storage located across a network.

1 32. The method of claim 22, wherein the obtaining planning preferences from the
2 adaptive learning engine further includes obtaining planning preferences from a plurality
3 of storages across a network of factories.

1 33. The method of claim 22, wherein the providing the final plan to the adaptive
2 learning engine further includes monitoring a plurality of forecasts from multiple sources.

1 34. The method of claim 33, wherein the monitoring a plurality of forecasts from
2 multiple sources further includes selecting an optimal forecast in response to the planning
3 preferences.
